

# Energy Diagnostics

Understand the true condition of your infrastructure. Gain confidence and savings.

Energy diagnostics is a comprehensive process aimed at evaluating energy consumption, identifying areas with the highest costs, and highlighting opportunities for optimization. This service is based on a detailed analysis of fuel, heat, and electricity flows within your facility.

## What do we offer?

- **Comprehensive system analysis** – thermographic inspections, condition checks of connections, performance parameter measurements
- **Identification of energy loss areas** – efficiency analysis, load measurements, detection of overloads
- **Enhanced energy security** – risk elimination, support for modernization planning
- **Report with recommendations** – a clear document outlining findings and specific actions to implement

## What do you gain?

- **Early detection of faults and overloads** – avoid costly failures and production downtime
- **Lower energy bills** – we identify areas of loss and inefficiency in electricity usage
- **Basis for investment decisions** – the diagnostic report provides a solid foundation for modernization planning, implementation of renewables, and energy storage systems
- **Compliance with audit requirements and standards** – documentation can support meeting legal and environmental regulations
